Any change in that global distribution would therefore immediately have effects on the forces felt. I see no reason to believe that Aristotle thought such an examination could not be informed by experience. Maudlin didn't state anything wrong in these pages, but he should have made the equation much more central to his explanation of what was going on. First, light from certain sources has the effect of causing discrete, countable events. More sophisticated understanding of this and a few other issues are only needed if one wishes to follow the defensive arguments the author mounts against potential attacks from his peers. It is primarily a work in the philosophy of physics. Quantum theory predicts that exactly the same correlations will continue unchanged no matter how far apart the two wings of the experiment are.

The relativity of simultaneity can be nicely illustrated by drawing in the va

such judgments depend upon the reference frame. The Special Theory confers upon light, or rather upon the speed of light in a vacuum, a unique role in the space-time structure.
